

# Fractals

A tribute to Benoît Mandelbrot  
(1924-2010)

# What is a fractal?

- A fractal is a shape that is self-similar (small parts of a fractal look like the whole fractal)
- Usually a fractal has finite area but infinite perimeter

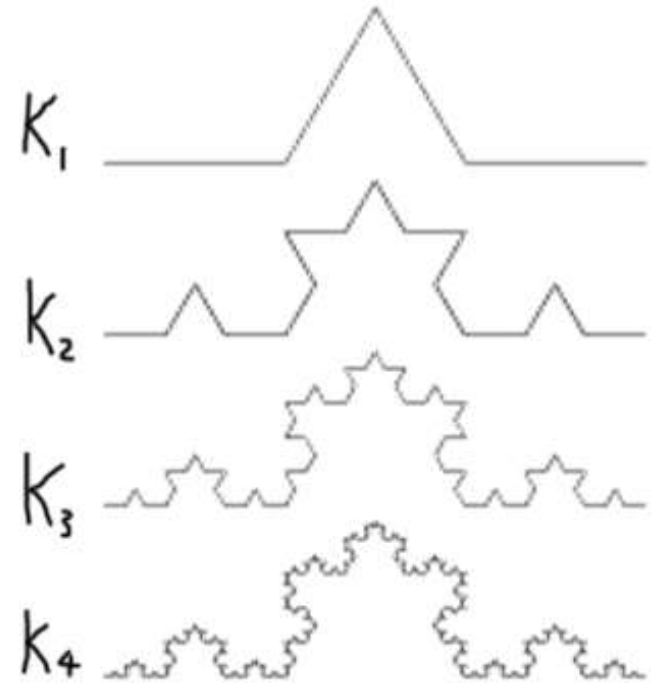

Mandelbrot Set

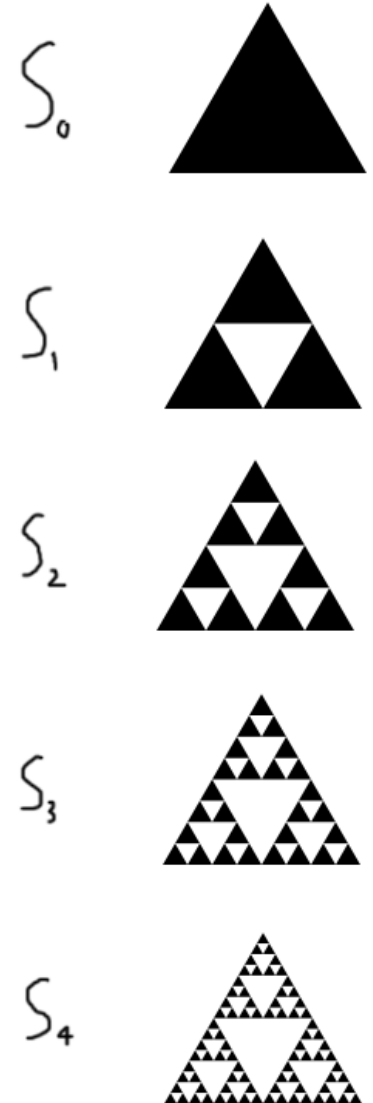

# Koch Curve

- A simple problem:
  - How many line segments are in  $K_n$ ?
  - $K_0$  has 1 segment
  - $K_1$  has 4 segments
  - $K_2$  has 16 segments
  - $K_{n+1}$  has 4 times as many as  $K_n$
  - Therefore  $K_n$  has  $4^n$  segments.
- Another simple problem:
  - What is the length of  $K_n$ ?
  - $K_0$  is 1 unit long
  - A segment in  $K_{n+1}$  is  $1/3$  as long as one in  $K_n$ .
  - Therefore a segment in  $K^n$  has length  $(1/3)^n$
  - $K_n$  has  $4^n$  segments
  - Length of  $K_n = 4^n * (1/3)^n$
  - Which is equal to  $(4/3)^n$ .

# Sierpinski Triangle

- Problem:
  - How many black triangles are in  $S_n$ ?
  - 1 triangle in  $S_0$
  - 3 black triangles in  $S_1$
  - $S_{n+1}$  has 3 times more triangles than  $S_n$
  - So  $S_n$  has  $3^n$  triangles.
- Another problem:
  - What is the area of  $S_n$ ?
  - $S_0$  has an area of 1
  - Each time,  $1/4$  of the area is removed
  - So area of  $S_{n+1}$  equals  $3/4 * S_n$
  - $S_n$  has area of  $(3/4)^n$

$$f(x) = \sum_{n=0}^{\infty} a^n \cos(b^n \pi x)$$

Weierstrass function: even functions can be fractals!

# Dimensions

---

Dimension = 1: Line

Dimension = 2: Square

Dimension = 3: Cube

# But why?

Why is a square 2-dimensional and a cube 3-dimensional?

1 square  
Side length = 1

A square can be broken down into 4 identical pieces with a magnification of 2.

4 squares  
Side length = 0.5

# Now for cubes

1 cube  
Side length = 1

A cube can be broken down into 8 identical pieces, each with a magnification of 2.

8 cubes  
Side length = 0.5

# Calculating Dimension

- Formula for dimension:

$$D = \frac{\log(\text{number of self similar objects})}{\log(\text{magnification factor})}$$

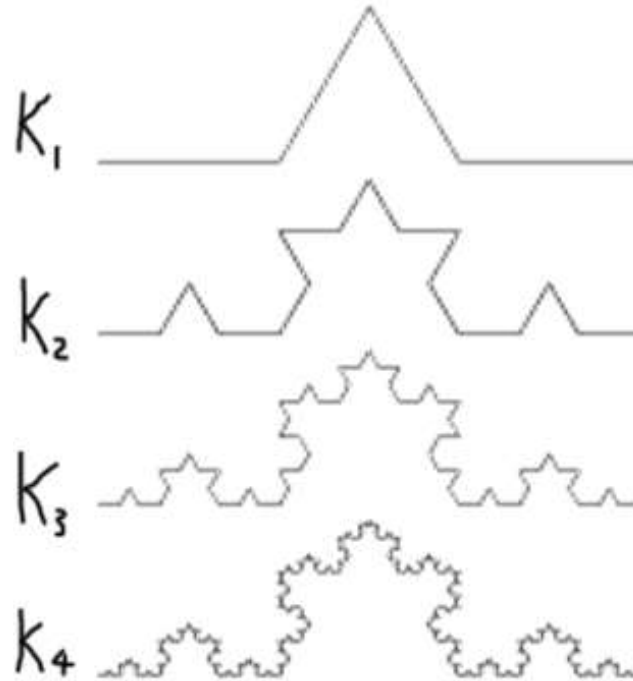

$$D = \log(4)/\log(2) = 2$$

$$D = \log(8)/\log(2) = 3$$

# Koch Curve

- What is the dimension?
- Each piece is split into 4 pieces
- Each piece is smaller by factor of 3
- Dimension =  $\log(4)/\log(3) \approx 1.26$

$$D = \frac{\log(\text{number of self similar objects})}{\log(\text{magnification factor})}$$

# Sierpinski Triangle

- What is the dimension?
- Each triangle becomes 3 smaller triangles
- Each triangle is smaller by factor of 2
- Dimension =  $\log(3)/\log(2) \approx 1.58$

$S_0$

$S_1$

$S_2$

$S_3$

$S_4$

$$D = \frac{\log(\text{number of self similar objects})}{\log(\text{magnification factor})}$$

# Cantor Set

- What is the dimension?
- 2 pieces, each smaller by factor of 3
- Dimension =  $\log(2)/\log(3) \approx 0.63$

# Vicsek Fractal

- What is the dimension?
- A cross becomes 5 crosses
- Each cross is 3 times smaller
- Dimension =  $\log(5)/\log(3) \approx 1.46$

# Menger Sponge

- What is the dimension?
- Cube becomes 20 cubes, each 3 times smaller
- Dimension =  $\log(20)/\log(3) \approx 2.73$
