## Harmonic Conjugates

(And lots of circles)
(Because we really like circles)

## Math Club 12/05/2011

## First Problem: Apollonius's Problem

- Your ship at point $A$ is chasing a ship on point $B$.
- Their ship is travelling in some direction at constant speed in a line.
- Your ship is $k$ times faster than their ship.
- Your ship must also sail in a straight line at constant speed.
- Which way should you go?

## Second Problem: What is a circle?

- Kaì navtì кह́vtpu kaì ठıaotṅuatı кúк入ov Ypá甲عoӨaı (a circle is defined by a center and a radius) - Euclid's Third Postulate
- Given $A$ and $B$ and a ratio $k$, $a$ circle is the set of points $P$ such that $\frac{P A}{P B}=k$ - Apollonius

## Harmonic Conjugates

- Is it possible to divide a line segment internally and externally in the same ratio?

- Here, let's say that $\frac{A C}{B C}=\frac{A D}{B D}$.
- We say $C$ and $D$ divide $A B$ harmonically.
- Then notice that $\frac{B C}{B D}=\frac{A C}{A D}$.
- So A and B divide CD harmonically as well.
- AB and CD are harmonic conjugates.

## Constructing Harmonic Conjugates (1)

- We have points A and B fixed, and have in mind some number $k$.
- We want a point $P$ such that AP is $k$ times BP.
- Draw a circle of any length around B.
- Then draw a circle $k$ times as long around A.
- Their intersection is a suitable $\mathbf{P}$, if they intersect.

## Constructing Harmonic Conjugates (2)

- We have a point $P$ now.
- Draw the internal bisector of $\mathbf{P}$ and let $C$ be the intersection with AB.
- Draw the external bisector of $\mathbf{P}$ and let $D$ be the intersection.
- AB and CD are harmonic conjugates!

## Constructing Harmonic Conjugates (3)

- Now does this actually work?
- By the angle bisector theorem, $\frac{A C}{B C}=\frac{A P}{B P}=k$.
- By the external angle bisector theorem, $\frac{A D}{B D}=\frac{A P}{B P}=k$.
- Hence $\frac{A C}{B C}=\frac{A D}{B D}=k$.
- So $A B$ and $C D$ are harmonic conjugates!

## Constructing the Circle of Apollonius

- $\frac{A C}{B C}=\frac{A D}{B D}=k$
- Notice that $\mathbf{P}$ is not part of this, so this works no matter what $P$ we choose.
- Also notice that CPD is a right angle.
- Then $P$ has to lie on the circle with diameter CD!

Page 8

## Apollonius, we solved your problem

- Which direction do we need to go?
- Knowing $A B$, we construct the harmonic conjugates CD
- Then we draw the circle with diameter CD
- We know their direction, so they are going to intersect the circle at some point, say $Q$.
- We just sail towards Q!
